9 ABSTRACT

10 A web-based transcription and reporting system allows
11 quick transcription of large numbers of utterances and
12 provides reports on the transcription data in logical
13 reports with linked access to underlying data. The system
14 includes time-saving transcription aids such as buttons
15 defining common noise events and anomalies. These
16 transcription aids additionally may be accessed via
17 keyboard shortcuts. Features of the web protocol are
18 included in the transcription process. Reports are
19 generated from the transcribed data meeting a set of
20 reporting criteria. Reports are presented in one of a set
21 of standard forms, wherein all standard forms include
22 drill-down linking to increasingly detailed levels of
23 supporting data.
